

Freegold Defines Significant Geophysical and Geochemical Targets at Shorty Creek

September 23, 2014 (Vancouver, BC) – Freegold Ventures Limited (**TSX:FVL Frankfurt: FR4N**) (“Freegold”) is pleased to announce that its recently completed geophysical survey on the Shorty Creek Project has defined significant chargeability anomalies which are coincident with strong copper, gold and bismuth geochemistry.

The Shorty Creek Project is a copper gold porphyry target located 100 km northwest of Fairbanks, Alaska and lies approximately 4 kms to the south of International Tower Hill's Livengood Project. Previous exploration on the project identified significant gold, copper and pathfinder elements associated with gold-copper porphyry style mineralization in limited shallow drilling.

Since acquiring the project in July 2014 Freegold's program has consisted of 28.6 line km of induced polarization surveying and the collection of 354 soil geochemical samples for multi element analysis and the staking of additional claims covering 5,200 acres increasing the project area to 20,920 acres.

Results show a strong chargeability anomaly which is over 2km long and 1km wide in the northwestern area of the grid. Coincident with the geophysical anomaly strongly anomalous copper values (up to 669 ppm) with significant molybdenum (up to 235 ppm) were returned.

In the southern portion of the grid, where previous drilling by Fairbanks Exploration and Asarco in 1989-1990 was completed, a significant chargeability zone was identified. Previous limited drilling in the area appears to have targeted the higher resistivity with some of the best copper grades appearing to be associated with the increasing chargeability to the southwest. Strongly anomalous gold (up to 480 ppb) and bismuth (up to 276 ppm) are associated with the area of increasing chargeability.

In addition to the geophysical and geochemical anomalies identified, extensive alteration and hornfels metamorphism spatially associated with small bodies of biotite granodiorite, quartz porphyry and aplite have previously been mapped over a 4km x 4 km area.

The Company is extremely pleased with the results to date and believes Shorty Creek project represents an excellent drill ready porphyry copper-gold target.

The Qualified Person who has reviewed the technical disclosure contained in this release is Alvin Jackson, P Geo-- VP Exploration and Development for the Company. Soil samples were delivered to ALS Chemex in Fairbanks, Alaska and were analyzed for multi elements using laboratory standard methods including checks and standards.

About Freegold Ventures Limited

Freegold is a TSX listed company focused on the exploration of gold projects in Alaska. Its flagship project is the Golden Summit Gold Project where a Preliminary Economic Assessment is currently underway. The Golden Summit project hosts an indicated NI 43-101 compliant resource of 79,800,000 t grading 0.66 g/t for a total of 1,683,000 oz, and an inferred resource of 248,060,000 t grading 0.61 g/t for a total of 4,841,000 oz using a 0.3 g/t cut-off. The indicated oxide resource using a 0.20 g/t cutoff is 25,026,200 t grading 0.55 g/t for a total of 439,000 oz and the inferred resource is 16,620,510 t grading 0.47 g/t for a total of 253,000 oz. The resource estimate was completed by Qualified Person Gary Giroux of Giroux Consultants in June 2013. The Technical Report documenting this estimate can be found on the Company's website or on SEDAR under the Company's profile.
